

Ragas: real RAG metrics

ragas.metrics.ExactMatch

```
ExactMatch(response="latte", reference="latte") -> 1.0
```

```
ExactMatch(response="americano", reference="espresso") -> 0.0
```

Same shape of question as topic 2's exact match -- this time it's ragas's own metric class doing the comparing, not ours.

A trivial metric, run for real -- the point is the object and the code path, not the difficulty.
