

What is a test set?

the eval's ground truth

```
N = 5 fixed cases
```

```
totals: $6.25, $8.00, $5.25, $7.00, $7.75
```

```
Same 5 cases, byte-identical, every single run.
```

```
Nothing here depends on what any model says.
```

The test set is the one part of an eval that must never be scripted -- it's already fixed.
