

A real trace: spans, tokens, cost

the span tree

```
spans: 6 (5 children + 1 root)
trajectory: model_call_1 -> tool_call_1 -> model_call_2 -> tool_call_2 ->
model_call_3
root tokens: 62    root cost: $0.00124
child token sum == root tokens, child cost sum == root cost
```

Same arithmetic invariant a real tracer enforces: parents summarize their children.
