

Langfuse, captured offline

CODA: the real library, captured offline

```
opentelemetry.sdk.trace.export.in_memory_span_exporter.InMemorySpanExporter  
langfuse.Langfuse(..., span_exporter=<in-memory exporter>)
```

The real SDK, pointed at a real OTEL exporter that never leaves the process. No server, no API call, no network flush.

langfuse v4 is OpenTelemetry-based -- swapping the exporter is a supported constructor argument.
