

Is the drop real? Statistical significance

sample size, variance, and a regression threshold

A pass rate is a proportion. A proportion measured on a small sample has a wide confidence interval -- the same 70% pass rate can mean 'clearly fine' or 'clearly broken' depending on n .

Wilson score interval, $z=1.96$ (95% CI), threshold=80%.

Regression rule: flagged only if the ENTIRE interval sits below the threshold.
