

vLLM, the throughput path

where Ollama tops out

```
this deck's two real serving calls (Ollama, litellm) both talked  
to ONE process, serving requests roughly one at a time.
```

```
that is the right choice for a laptop, a demo, or a single user --  
and the wrong choice once real concurrent traffic shows up.
```

Ollama serves you well until throughput, not correctness, becomes the constraint.
