

Chains can't loop

the demand: re-enter the pipe

```
Maya: "oat milk's out -- can I pick again?"
```

```
propose -> check the real Stock -> out -> ask again -> propose
```

That last arrow points BACKWARD, into the pipe's own start.
A chain has one direction. Once it finishes, it is done.

Chains have no such arrow: there is nothing built in to re-enter.
