

From prose to objects

the schema: what the till can actually process

```
class OrderItem(BaseModel):  
    drink: str  
    size: str = "medium"  
    extras: list[str] = []  
  
class Order(BaseModel):  
    items: list[OrderItem]  
    food: list[str] = []  
    to_go: bool = False
```

A pydantic model is the contract. The parser will enforce it.
