

Resume without double-charging

Act 1: the bug, for real -- a naive refund node

```
def naive_refund(state):  
    till.refund(state["amount"]) # ABOVE the interrupt  
    answer = interrupt({"amount": state["amount"]})  
    return {"approved": answer["approved"]}
```

LangGraph replays a node from its top on resume,
so the line above `interrupt()` runs again.

LangGraph's docs warn that code before an `interrupt` runs again on resume.
