

State and reducers

why this matters

Deltas + reducers is what makes parallel branches mergeable.

Two nodes can each return `{'items': [x]}` in the same step and nobody clobbers anybody -- the add reducer folds both in.

Same story for messages: a same-id return replaces instead of piling up a duplicate. total (overwrite) is the one channel where the last write really does win.

This real run ended with 2 items and a total of 10.25 -- deltas plus reducers made the merge automatic.
