

The agent is a two-node cycle

compute_price: real arithmetic over MENU/SIZES/EXTRAS, never model arithmetic

```
MENU['espresso']      = $3.00
SIZES['large']         = $1.00
EXTRAS['extra shot']  = $1.00
-----
total                  = $5.00

compute_price(drink='espresso', size='large', extras=['extra shot'])
-> '$5.00'
```

The ToolMessage content is the same \$5.00 you get calling compute_price directly.
